

## Security Awareness Training

---

Email is a hacker's favorite tool. Today's employees are regularly exposed to phishing and ransomware attacks that put organizations at risk, and training employees to recognize threats is an essential part of cybersecurity.

**WorkSmart's Security Awareness Training** solution reduces malware infections, data loss, cyber theft, and employee downtime. It's an ongoing training program that helps employees play a vital role in cybersecurity defense.

### Baseline Testing

A simulated phishing attack assesses the percentage of your users prone to phishing.

### Training

On-demand, interactive, web-based training with common traps and scenario-based exercises. And automated "nudge" emails to users who haven't completed training.

### Regular Phishing Tests

Hundreds of templates are used to automate simulated phishing attacks that reinforce training, create change in employee security behavior and meet regulatory compliance requirements.

### Reporting Access

Automated reports on user training completions, phish-prone percentage, compliance, and more. And admin access to adjust user lists and review reports at any time to see how the program is working for your business.
